# EG4® 12kPV HYBRID INVERTER

# TROUBLESHOOTING & MAINTENANCE GUIDE

The purpose of this document is to educate the end-user on troubleshooting and maintaining the integrity of the 12kPV hybrid inverter.

## **TABLE OF CONTENTS**

## 2. SAFETY

### 2.1 SAFETY INSTRUCTIONS

International safety regulations have been strictly observed in the design and testing of the inverter. Before beginning any work, carefully read all safety instructions, and always observe them when working on or with the inverter. The installation must follow all applicable national or local standards and regulations.

### Incorrect installation may cause:

- Injury or death to the installer, operator or third party
- Damage to the inverter or other attached equipment

### 2.2 IMPORTANT SAFETY NOTIFICATIONS

Hazardous Voltage Circuits! Circuits à tension élevée!

There are various safety concerns that must be carefully observed before, during, and after the installation, as well as during future operation and maintenance. The following are important safety notifications for the installer and any end users of this product under normal operating conditions.

- Beware of high PV voltage. Please install an external DC disconnect switch or breaker and ensure it is in the "off" or "open" position before installing or working on the inverter. Use a voltmeter to confirm there is no DC voltage present to avoid electric shock.
- 2. **Beware of high grid voltage.** Please ensure the AC switch and/or AC breaker are in the "off" or "open" position before installing or working on the inverter. Use a voltmeter to confirm there is no voltage present to avoid electric shock.
- 3. **Beware of high battery current.** Please ensure that the battery module breakers and/or on/off switches are in the "open" or "off" position before installing or working on the inverter. Use a voltmeter to confirm there is no DC voltage present to avoid electric shock.
- 4. Do not open the inverter while it is operating to avoid electric shock and damage from live voltage and current within the system.
- 5. Do not make any connections or disconnections (PV, battery, grid, communication, etc.) while the inverter is operating.
- 6. An installer should make sure to be well protected by reasonable and professional insulative equipment [e.g., personal protective equipment (PPE)].
- 7. Before installing, operating, or maintaining the system, it is important to inspect all existing wiring to ensure that it meets the appropriate specifications and conditions for use.
- 8. Ensure that the PV, battery, and grid connections to the inverter are secure and proper to prevent damage or injuries caused by improper installation.
- 9. Some components of the system can be very heavy. Be sure to utilize team-lift among other safe lifting techniques throughout the installation.

## WARNING! To reduce the risk of injury, read all instructions

All work on this product (system design, installation, operation, setting, configuration, and maintenance) must be carried out by qualified personnel. To reduce the risk of electric shock, do not perform any servicing other than those specified in the operating instructions unless qualified to do so.

- 1. Read all instructions before installing. For electrical work, follow all local and national wiring standards, regulations, and these installation instructions.
- 2. Make sure the inverter is properly grounded. All wiring should be in accordance with the National Electrical Code (NEC), ANSI/NFPA 70.
- 3. The inverter and system can inter-connect with the utility grid only if the utility provider permits. Consult with the local AHJ (Authority Having Jurisdiction) before installing this product for any additional regulations and requirements for the immediate area.
- 4. All warning labels and nameplates on the inverter should be clearly visible and must not be removed or covered.
- 5. The installer should consider the safety of future users when choosing the inverter's correct position and location as specified in this manual.
- 6. Please keep children from touching or misusing the inverter and relevant systems.
- 7. **Beware!** The inverter and some parts of the system can be hot when in use. Please do not touch the inverter's surface or most of the parts when they are operating. During operation, only the LCD and buttons should be touched.

## **DISCLAIMER**

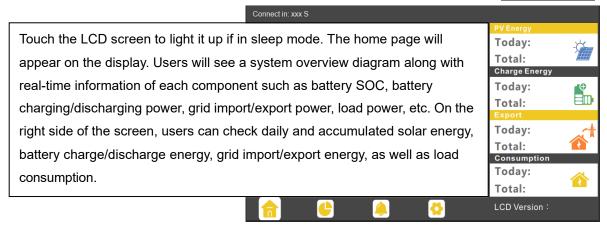

EG4 reserves the right to make changes to the material herein at any time without notice. Please refer to <a href="https://www.eg4electronics.com">www.eg4electronics.com</a> for the most updated version of our manuals/spec sheets.

## 3. INVERTER TROUBLESHOOTING

Please follow the troubleshooting steps in the tables below when encountering any faults and/or errors on the inverter.

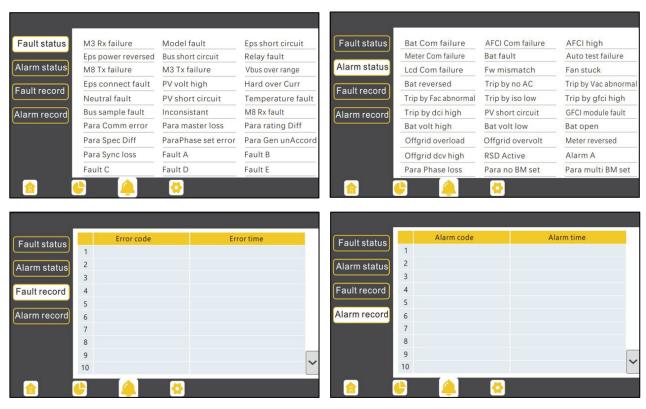

### 3.1 VIEWING INFORMATION AND ALARM FAULT/RECORD

#### Home Screen

## Fault/Alarm Information

By touching the bell icon at the bottom of the screen, users will see all the current and historical faults and warning information on this page.

### 3.2 REGULAR MAINTENANCE

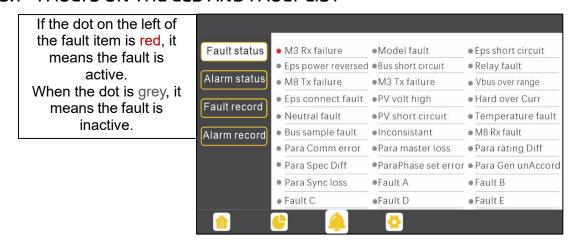

#### **Inverter Maintenance**

- Inspect the inverter every 6 months to check for any damaged cables, accessories, or terminals, and inspect the inverter itself.
- Inspect the inverter every 3 months to verify if the operating parameters are normal and there is no abnormal heating or noise from all components in the system.
- Inspect the inverter every month to confirm nothing covers the inverter heat sink. If there is, shut down the inverter and clear the heat sink to restore proper cooling.

### 3.3 TROUBLESHOOTING BASED ON LCD SCREEN

Once there is any warning or fault occurring, users can troubleshoot according to the LED status description and the warning/fault information on the LCD screen.

### 3.3.1 FAULTS ON THE LCD AND FAULT LIST

| FAULT               | MEANING   | TROUBLESHOOTING   |  |
|---------------------|---|---|--|
| M3 Rx failure       | M3 microprocessor fails to receive data from DSP                            | Restart the inverter. If the error persists,  |  |
| Model fault         | Incorrect model value   | contact the supplier.   |  |
| EPS short circuit   | Inverter detected short-circuit on load output terminals                    | <ol> <li>Check if the L1, L2, and N wires are connected correctly at the inverter load output terminal.</li> <li>Disconnect the load breaker to see if fault remains. If the fault persists, contact the supplier.</li> </ol> |  |
| EPS power reversed  | Inverter detected power flowing into load terminal                          |   |  |
| Bus short circuit   | DC Bus is short circuited   |   |  |
| Relay fault         | Relay abnormal  | Restart the inverter. If the fault persists,  |  |
| M8 Tx failure       | DSP fails to receive data from M8 microprocessor                            | contact the supplier.   |  |
| M3 Tx failure       | DSP fails to receive data from M3 microprocessor                            |   |  |
| Vbus over range     | DC Bus voltage too high   | Ensure the PV string voltage is within the inverter specification. Also, check inverter and battery voltage. If voltage readings are within range and this fault persists, contact the supplier.                              |  |
| EPS connect fault   | Load terminal and grid terminal are connected wired incorrectly or reversed | Check if the wires on load terminal and grid terminal are wired. correctly. If the fault persists, contact the supplier.  |  |
| PV volt high        | PV voltage is too high  | Please check if the PV string voltage is within the inverter specification. If string voltage is within range and this fault persists, contact the supplier.  |  |
| Hard over curr      | Hardware level over current protection triggered                            | Restart the inverter. If the fault persists, contact the supplier.  |  |
| Neutral fault       | Voltage between N and G is greater than 30V                                 | Ensure the neutral wire is connected correctly.   |  |
| PV short circuit    | Short circuit detected on PV input  | Disconnect all PV strings from the inverter. If the error persists, contact the supplier.   |  |
| Temperature fault   | Heat sink temperature too high  | Install the inverter in a place with good ventilation and no direct sunlight. If the installation site is okay, check if the NTC connector inside the inverter is loose.  |  |
| Bus sample<br>fault | Inverter detected DC bus voltage lower than PV input voltage                |   |  |
| Inconsistent        | Sampled grid voltage values of DSP and M8 microprocessor are inconsistent   | Restart the inverter, if the fault persists, contact the supplier.  |  |
| M8 Rx fault         | M8 microprocessor fails to receive data from DSP                            |   |  |
| Para Comm error     | Parallel communication abnormal   | Check whether the connection of the parallel cable is loose. Connect the parallel cable correctly.     Ensure the PIN status of the CAN communication cable from the first to the end inverter is connected correctly.        |  |

| Para master loss        | No Master in the parallel system                  | 1. If a Master has been configured in the system, the fault will automatically be removed after the Master works.  2. If a Master has not been configured and there are only Slaves in the system, set the Master first.  Note: For a single-unit system, the role of the inverter should be set as "1 phase Master." |  |
|-------------------------|---|---|--|
| Para rating Diff        | Rated power of parallel inverters is inconsistent | Confirm that the rated power of all inverters is the same.  |  |
| Para Phase set<br>error | Incorrect setting of phase in parallel            | First confirm the wiring for the parallel system is correct. Once verified, connect each inverter to the grid. The system will automatically detect the phase sequence and the fault automatically resolves after the phase sequence is detected. If the fault persists, contact the supplier.                        |  |
| Para Gen in Accord      | Inconsistent generator connection in parallel     | Some inverters are connected to generators, and some are not. Confirm <i>all</i> inverters in parallel are connected to common generator output, or <i>none</i> are connected to generators.  |  |
| Para sync loss          | Parallel inverter fault                           | Restart the inverter. If the fault persists, contact the supplier.  |  |

## 3.4 ALARM ON THE LCD AND ALARM LIST

If the dot to the left of the fault item is yellow, it means the Fault status Bat Com failure AFCI Com failure AFCI high Meter Com failure Bat fault Auto test failure fault is active. When it is grey, Alarm status Lcd Com failure Fw mismatch • Fan stuck it means the fault is inactive. Bat reversed • Trip by no AC Trip by Vac abnormal Fault record • Trip by Fac abnormal • Trip by iso low Trip by gfci high Alarm record Trip by dci high PV short circuit GFCI module fault Bat volt high Bat volt low Bat open Offgrid overload Offgrid overvolt Meter reversed Offgrid dcv high RSD Active • Alarm A Para multi BM set Para Phase loss • Para no BM set

### **Alarm List**

| ALARM             | MEANING  | TROUBLESHOOTING   |
|-------------------|--|---|
| Bat com failure   | Inverter fails to communicate with battery                   | Check if the communication cable pinout is correct, and if the correct battery brand is selected on the inverter's LCD. If all is correct but the alarm persists, contact the supplier.   |
| AFCI com failure  | Inverter fails to communicate with AFCI module               | Restart inverter. If the error continues, contact the supplier.   |
| AFCI high         | PV arc fault is detected                                     | Check each PV string for correct open- circuit voltage and short-circuit current. If the PV strings are in good condition, please clear the alarm on the inverter LCD.  |
| Meter com failure | Inverter fails to communicate with the meter                 | Check if the communication cable is connected correctly and in good working condition. Restart inverter. If the alarm persists, contact the supplier.   |
| Bat Fault         | Battery cannot charge or discharge                           | <ol> <li>Check the battery communication cable for correct pinout on both inverter and battery end.</li> <li>Check if an incorrect battery brand is selected.</li> <li>Check if there is fault on battery's indicator. If there is a fault, please contact the battery supplier.</li> </ol> |
| LCD com failure   | LCD fails to communicate with M3 microprocessor              | Restart the inverter. If the fault still occurs, contact the supplier.  |
| Fwm mismatch      | Firmware version mismatch between the microprocessors        | Restart the inverter. If the fault still occurs, contact the supplier.  |
| Fan stuck         | Cooling fan(s) are stuck                                     | Restart the inverter. If the fault still occurs, contact the supplier.  |
| Trip by GFCI high | Inverter detected leakage current on AC side                 | <ol> <li>Check if there is ground fault on grid and load side.</li> <li>Restart inverter. If the alarm persists, contact the supplier.</li> </ol>   |
| Trip by dci high  | Inverter detected high DC injection current on Grid terminal | Restart inverter. If the alarm persists, contact the supplier.  |

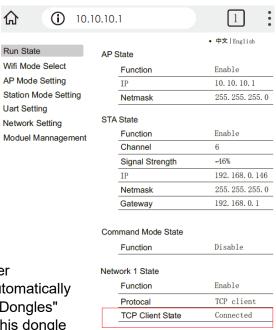

| PV short circuit  | Inverter detected a short circuit in PV input                  | Check whether each PV string is connected correctly.     Restart inverter. If the alarm persists, contact the supplier.  |  |
|-------------------|--|--|--|
| GFCI module fault | GFCI module is abnormal  | Restart inverter. If the alarm persists, contact the supplier.   |  |
| Bat volt high     | Battery voltage too high                                       | Check whether the battery voltage exceeds 59.9V; battery voltage should be within inverter specification.  |  |
| Bat volt low      | Battery voltage too low  | Check whether the battery voltage is under 40V; battery voltage should be within inverter specification.   |  |
| Bat open          | Battery is disconnected from inverter                          | Check battery breaker or battery fuse. Reconnect as needed.  |  |
| Off-grid overload | Overload on Load terminal                                      | Check if load power on inverter LOAD terminal is within inverter specification.  |  |
| Off-grid overvolt | Load voltage is too high                                       | Restart inverter. If the alarm persists, contact the supplier.   |  |
| Meter reversed    | Meter connection is reversed                                   | Check if the meter communication cable is connected correctly on the inverter and meter sides.   |  |
| Off-grid dcv high | High DC voltage component on load output when running off-grid | Restart inverter. If the alarm persists, contact the supplier.   |  |
| RSD Active        | Rapid shutdown activated                                       | Check if the RSD switch is pressed.  |  |
| Para phase loss   | Phase losing in parallel system                                | Confirm that the wiring of the inverter is correct. If the Master is set to 3-phase Master the number of parallel inverters must be ≥3. (The grid input for each inverter should be connected correctly to Grid L1, L2, L3.) If the Master is set to 2x 208 Master, the number of parallel inverters needs to be ≥2. (And the ginput of each inverter should be connected correctly to Grid L1, L2, L3.) |  |
| Para no BM set    | Master is not set in the parallel system                       | Set one of the inverters in the parallel system as the Master.   |  |
| Para multi BM set | Multiple Primaries have been set in the parallel system        | There are at least two inverters set as the Master in the parallel system. Keep one Master and set the other as Slave.   |  |

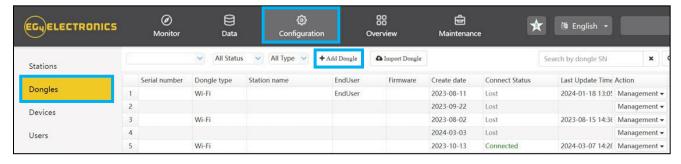

## 4. TROUBLESHOOTING WI-FI MODULE

### 4.1 CENTER LIGHT FLASHING

Why is the middle light for the Wi-Fi module flashing? After setting the right Wi-Fi password, all three lights should be on solidly. If it is still flashing, try the following:

- 1. Check to see if the Wi-Fi is connected and that the correct password has been entered. The device can be used to connect to a Wi-Fi hotspot and visit the website 10.10.10.1 to check; the TCP client status should be "connected" as seen in the image. The login username and password are both "admin." Check your Wi-Fi name and password if it is.
- 2. Prior to setting the password, add the dongle to the system. After registering and entering the Wi-Fi SN and PIN, this dongle is automatically added to the system. While logged in, go to "Configuration" -> "Dongles" -> "Add dongle" on <a href="https://monitor.eg4electronics.com/">https://monitor.eg4electronics.com/</a> to add this dongle to the current configuration if you have more than one dongle. Restart the Wi-Fi module by unplugging it and plugging it back in after installing the dongle.

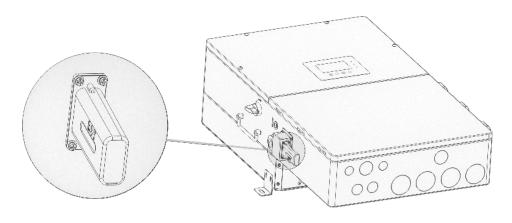

#### 4.2 DONGLE RECOVERY

This guide will detail the steps needed to recover Wi-Fi dongles with serial numbers starting with the letters "BA" after being reset to factory settings.

Please read the guide in its entirety before performing the steps listed below.

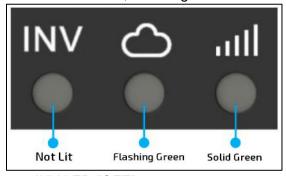

#### Step 1

Connect the dongle to the inverter's Wi-Fi dongle port as shown below.

### Step 2

After ~30 seconds, the dongle's LED status will appear as shown below.

- INV LED "OFF"
- Network LED "Blinking"
- Module LED "ON"

### Step 3

Connect the mobile device/PC to the dongle's network. The network name will match the serial number (SN) on the outer shell of the dongle. If unable to locate the network named after the SN, check for a network named, "MXCHIP-xxxxxxxx". Write this number down for step 6.

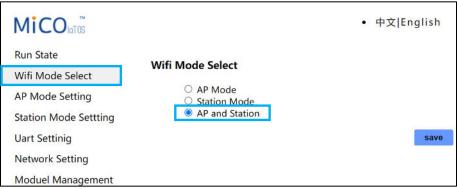

## Step 4

Enter "10.10.10.1" (no quotes) into the browser. Both the username and the password are "admin" (no quotes). After logging in, select the language on the right side. See image below.

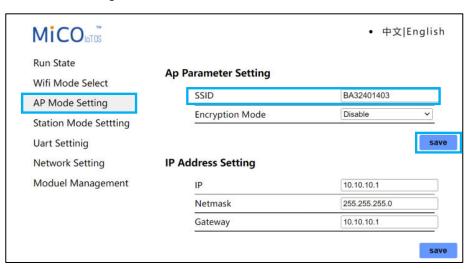

### Step 5

Select the "Wifi Mode Select" option on the left-hand side of the screen. From here, select "AP and Station" and save. See image below.

#### Step 6

Next, select the "AP Mode Setting" on the left-hand side of the screen. Enter the dongle's SSID and select "save". The SSID will match the dongle's SN or "MXCHIP-xxxxxx" as determined by step 3 above. See image below for reference.

## Step 7

Navigate to the "Network Setting" page. Under "Network Connection 1 Setting", enter the following data and save.

Protocol: TCP Client

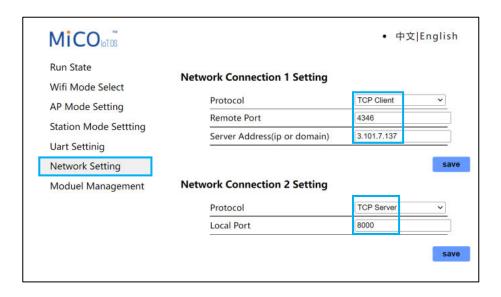

Remote Port: 4346

• Server Address (IP or domain) 3.101.7.137

Under "Network Connection 2 Setting", enter the following data and save. (see image below)

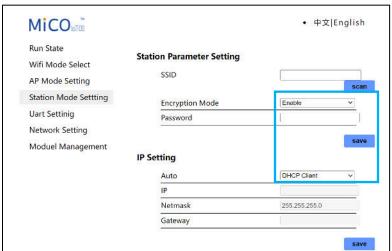

Protocol: TCP Server

Local Port: 8000

#### Step 8

Navigate to the "Station Mode Setting" page. Enter the home Wi-Fi SSID information. Ensure that "Encryption Mode" is set to "Enable". Enter in the home Wi-Fi password and select "Save". See figure below.

## 5. STORAGE INFORMATION

If placing the inverter into storage upon receipt, keep the following factors in mind when selecting a storage location.

- 1. The inverter and its components must be stored in its original packaging.
- 2. The storage environment temperature should remain within  $-13^{\circ}F 140^{\circ}F$  ( $-25^{\circ}C 60^{\circ}C$ ), and humidity should be within 30% 75%.
- 3. The packing should remain upright.
- 4. **Do not** store the inverter or its packaging in direct sunlight or where there is potential for water to accumulate.

**NOTE**: If any of the warnings or faults from either table persist, please contact the distributor for additional troubleshooting steps.
